Existence of Nonoscillatory Solutions of Third-Order Nonlinear Neutral Delay Difference Equations

A. George Maria Selvam, C. Silambarasan **M. Paul Loganathan** Sacared Heart College Department of Mathematics Tirupattur Dravidian University

Kuppam

ABSTRACT: In this paper, we consider the following third order nonlinear neutral delay difference equation
 $\Delta \left(a(n) \left(\Delta^2 \left(x(n) + p(n) x (\delta(n)) \right) \right)^r \right) + q(n) x^r (\tau(n)) = e(n)$ equation

$$
\Delta\bigg(a(n)\big(\Delta^2\big(x(n)+p(n)x(\delta(n))\big)\big)^r\bigg)+q(n)x^r\big(\tau(n)\big)=e(n)
$$

Where $a(n)$, $p(n)$, $q(n)$, $e(n)$ are real sequences. We use the Krasnoselskii's fixes point

theorem to establish the existence of nonoscillatory solutions. *2000 Mathematics Subject Classification 39A10*

Key words and phrases Oscillation, Third order, Neutral Difference equations, Existence

1. INTRODUCTION:

We consider the nonlinear neutral delay difference equations of the form

UCTION:
\nthe nonlinear neutral delay difference equations of the form
\n
$$
\Delta \Big(a(n) \Big(\Delta^2 \big(x(n) + p(n)x(\delta(n))\big)\Big)^\gamma + q(n)x^\gamma \big(\tau(n)\big) = e(n).
$$
\n(1.1)

where γ is a quotient of odd positive integers, Δ is a forward difference operator defined by $\Delta x(n) = x(n+1) - x(n)$, δ , τ are positive integers and $n \in N_{n_0} = \{n_0, n_0 + 1, \dots\}$, n_0 is a nonnegative integer.

We set $z(n) = x(n) + p(n)x(\delta(n))$. The oscillatory and nonoscillatory behavior of solutions of difference equations have been considered in $\lceil 1 \rceil - \lceil 9 \rceil$ and conditions for the existence of nonoscillatory solutions using either Schauder fixed point theorem or Banach contraction principle are obtained. The aim of this paper is to obtain sufficient conditions for the existence of nonoscillatory solution of equation (1.1) using Krasnoselskii's fixed point theorem.

Let $\theta = \max{\{\delta, \tau\}}$. By a solution of equation (1.1) we mean a real sequence $x(n)$ is defined for

all $n \ge n_0 - \theta$ satisfies (1.1) for all $n \ge n_0$. A nontrivial solution $x(n)$ is said to be oscillatory if it is neither eventually positive nor eventually negative; otherwise, it is nonoscillatory. Equation (1.1) is said to be oscillatory if all its solutions are oscillatory.

2. EXISTENCE OF NONOSCILLATORY SOLUTIONS

In this section we establish sufficient condition for the existence of bounded nonoscillatory solution of equation (1.1).

Lemma 2.1 (Krasnoselskii's Fixed Point Theorem): Let X be a Banach space, let Ω be a bounded closed convex subset of X and let S_1 , S_2 be maps of Ω into X such that $S_1x + S_2y \in \Omega$ for every pair x, $y \in \Omega$. If S_1 is a contraction and S_2 is completely continuous, then the equation $S_1x + S_2y = x$ has a solution in Ω .

Theorem 2.2Assume that $-1 < c_1 \le p(n) \le 0$ and that

$$
\sum_{n=n_0}^{\infty} |q(n)| < \infty, \tag{2.1}
$$

 International Journal Of Engineering Research & Management Technology ISSN: 2348-4039

Email: editor@ijermt.org **March- 2016 Volume 3, Issue-2** www.ijermt.org

$$
\sum_{n=n_0}^{\infty} |e(n)| < \infty \,, \tag{2.2}
$$

and

$$
\sum_{n=n_0}^{\infty} \left| \frac{1}{a^{\gamma}(n)} \right| < \infty. \tag{2.3}
$$

Then equation (1.1) has a bounded nonoscillatory solution.

Proof. By $(2.1) - (2.3)$, we choose $n \ge n_0$ sufficiently such that

Proof. By (2.1) – (2.3), we choose
$$
n \ge n_0
$$
 sufficiently such that\n
$$
\sum_{l=n_1}^{\infty} \sum_{t=l}^{\infty} \left(\left| \frac{1}{a(t)} \right| \sum_{s=t}^{\infty} |q(s)| M_1 + |e(s)| \right)^{\frac{1}{\gamma}} < \frac{1}{3} (1+c_1).
$$

where $M_1 = \max_{2(1+c_1) \le x \le 4} |x^{\gamma}(\tau(s))|$ $\frac{1}{3} \leq x \leq \frac{1}{3}$ $\max_{x \in C_1}$
 $\sum_{n=1}^{\infty}$ $M_1 = \max_{\frac{2(1+c_1)}{2} \leq x \leq \frac{4}{5}} |x^{\gamma}| (\tau)$ $=\max_{2(1+c)} |x^{\gamma}(\tau(s))|$. Let $\ell_{n_0}^{\infty}$ ℓ_{n}^{∞} be the set of all real sequences with the norm

 (n) $\bf{0}$ sup *n n* $||x|| = \sup_{n \ge n_0} |x(n)||$ $=\sup|x(n)| < \infty$. Then $\ell_{n_0}^{\infty}$ ℓ_{n}^{∞} is a Banach space. We define a closed, bounded and convex subset Ω of $\ell_{n_{\text{e}}}^{\infty}$ as follows.

$$
\ell_{n_0}^{\infty} \text{ as follows.}
$$

\n
$$
\Omega = \left\{ x = \left\{ x(n) \right\} \in \ell_{n_0}^{\infty} : \frac{2}{3} (1 + c_1) \le x(n) \le \frac{4}{3}, n \ge n_0 \right\}.
$$

Define two maps S_1 and S_2 : $\Omega \rightarrow \ell_{n_0}^{\infty}$ as follows:

Define two maps
$$
S_1
$$
 and $S_2 : \Omega \to \ell_{n_0}^{\infty}$ as follows:
\n
$$
(S_1x)_n = \begin{cases} 1 + c_1 - p(n)x(\delta(n)), & n \ge n_1, \\ (S_1x)_n, & n_0 \le n \le n_1. \end{cases}
$$
\n
$$
(S_2x)_n = \begin{cases} \sum_{l=n}^{\infty} \sum_{t=l}^{\infty} \left(\frac{1}{a(t)} \sum_{s=t}^{\infty} (q(s)x^{\gamma}(\tau(s)) - e(s)) \right)^{\frac{1}{\gamma}}, & n \ge n_1, \\ (S_2x)_n, & n_0 \le n \le n_1. \end{cases}
$$

Case 1.(i) We shall show that for any $x, y \in \Omega$, $(S_1x)_n + (S_2y)_n \in \Omega$. In fact for every $x, y \in \Omega$ and $n \ge n_0$, we get
 $(S_1x)_n + (S_2y)_n \le 1 + c_1 - p(n)x(\delta(n)) + \sum_{l=n}^{\infty} \sum_{t=l}^{\infty} \left(\frac{1}{a(t)} \sum_{s=t}^{\infty} (q(s)y^{\gamma}(r(s)) - e(s)) \right)^{\frac{1$ we get $(S_1x)_n + (S_2y)_n \in \Omega$. In fact for every $x, y \in \Omega$
 $\left(\frac{1}{\sqrt{2}} \sum_{n=1}^{\infty} (q(s)y^{\gamma}(r(s)) - e(s))\right)^{\frac{1}{\gamma}}$

$$
[(S_2x)_n, n_0 \le n \le n_1.
$$

\n**Case 1.**(i) We shall show that for any $x, y \in \Omega$, $(S_1x)_n + (S_2y)_n \in \Omega$. In fact for every $x, y \in \Omega$
\nwe get
\n
$$
(S_1x)_n + (S_2y)_n \le 1 + c_1 - p(n)x(\delta(n)) + \sum_{l=n}^{\infty} \sum_{t=l}^{\infty} \left(\frac{1}{a(t)} \sum_{s=t}^{\infty} (q(s)y^{\gamma}(r(s)) - e(s)) \right)^{\frac{1}{\gamma}}
$$
\n
$$
\le 1 + c_1 - \frac{4}{3}c_1 + \sum_{l=n_1}^{\infty} \sum_{t=l}^{\infty} \left(\left| \frac{1}{a(t)} \right| \sum_{s=t}^{\infty} |q(s)| M_1 + |e(s)| \right)^{\frac{1}{\gamma}}
$$
\n
$$
\le 1 + c_1 - \frac{4}{3}c_1 + \frac{1+c_1}{3} = \frac{4}{3}.
$$

\nFurthermore we have.

Furthermore we have,

\n
$$
(S_xY)_x + (S_yY)_x \ge 1 + c_1 - p(n)x(\delta(n)) - \sum_{i=0}^{\infty} \sum_{i=0}^{n} \left(\frac{1}{a(t)} \sum_{j=0}^{\infty} (q(s)y^2(\tau(s)) - e(s)) \right)^{\frac{1}{2}}
$$
\n
$$
\ge 1 + c_1 - \sum_{i=0}^{\infty} \sum_{i=1}^{n} \left(\frac{1}{a(t)} \sum_{i=1}^{\infty} (q(s))M_1 + |e(s)| \right)^{\frac{1}{2}}
$$
\n
$$
\ge 1 + c_1 - \frac{1 + c_1}{3} = \frac{2(1 + c_1)}{3}.
$$
\nHence
\n
$$
\frac{2(1 + c_1)}{3} \leq (S_xY)_x + (S_xY)_x \leq \frac{4}{3}, \quad n \geq n_0.
$$
\nThus we have proved that $(S_xY)_x + (S_yY)_x \in \Omega$ for any *x*, *y* ∈ Ω. (ii) $n_0 \leq n \leq n_1$. For any *x* ∈ Ω, we know that $(S_xY)_x = (S_xY)_x$ and $(S_xY)_x = (S_xY)_x$.
\n
$$
\frac{2(1 + c_1)}{3} \leq (S_xY)_x + (S_xY)_x \leq \frac{4}{3}.
$$
\nConsidering the two cases, for any *x* ∈ Ω, we have
\n
$$
\frac{2(1 + c_1)}{3} \leq (S_xY)_x + (S_xY)_x \leq \frac{4}{3}.
$$
\nConsidering the two cases, for any *x* ∈ Ω, we have
\n
$$
\frac{2(1 + c_1)}{3} \leq (S_xY)_x + (S_xY)_x \leq \frac{4}{3}.
$$
\nConsider this, is a contraction mapping on Ω. For *x*, *y* ∈ Ω and *n* ≥ *n*, we have
\n
$$
(\sqrt{3}, \sqrt{3}, \sqrt{3}, \sqrt{3}, \sqrt{3}, \sqrt{3}, \sqrt{3},
$$

Hence

Hence
\n
$$
\frac{2(1+c_1)}{3} \le (S_1x)_n + (S_2y)_n \le \frac{4}{3}, \quad n \ge n_0.
$$

Thus we have proved that $(S_1x)_n + (S_2y)_n \in \Omega$ for any $x, y \in \Omega$.

(ii) $n_0 \le n \le n_1$. For any $x \in \Omega$ we know that $(S_1x)_n = (S_1x)_{n_1}$ and $(S_2x)_n = (S_2x)_{n_1}$.

$$
\frac{2(1+c_1)}{3} \le (S_1x)_{n_1} + (S_2x)_{n_1} \le \frac{4}{3}.
$$

Considering the two cases, for any $x \in \Omega$, we have $2(1+c_1)$, $\leq (S, x) \leq \frac{4}{\pi}$

$$
\frac{2(1+c_1)}{3} \le (S_1x)_n + (S_2x)_n \le \frac{4}{3}.
$$

Case 2. We shall show that S_1 is a contraction mapping on Ω . For $x, y \in \Omega$ and $n \ge n_0$, we have Case 2. We shall show that S_1 is a contraction mapping on Ω . F
 $(S_1x)_n + (S_2y)_n \le -p(n)|x(\delta(n)) - y(\delta(n))| \le -c_1 ||x - y||$.

Since $0 < -c_1 < 1$, we conclude that S_1 is a contraction mapping on Ω .

Case 3. next we shall show that S_2 is uniformly Cauchy. First we shall show that S_2 continuous. Let $\{x^i\}$ be a sequence in Ω such that $x^{(i)} \to x = x(n)$ as $i \to \infty$. Since Ω is closed $x \in \Omega$. Furthermore, for $n \ge n_1$ we have,
 $\left| \left(S_2 x^{(i)} \right)_n - \left(S_2 x \right)_n \right| \le \sum_{l=n_1}^{\infty} \sum_{t=l}^{\infty} \left(\left| \frac{1}{a(t)} \right| \sum_{s=t}^{\infty} |q(s)| |x^{$ $n \geq n_1$ we have, $\left(\frac{1}{\sqrt{2}} \int_{-\infty}^{\infty} |g(s)||x^{(i)\gamma}(\tau(n)) - x^{\gamma}(\tau(n))| \right)^{\frac{1}{\gamma}}$

$$
n \ge n_1 \text{ we have,}
$$
\n
$$
\left| \left(S_2 x^{(i)} \right)_n - \left(S_2 x \right)_n \right| \le \sum_{l=n_1}^{\infty} \sum_{t=l}^{\infty} \left(\left| \frac{1}{a(t)} \right| \sum_{s=t}^{\infty} |q(s)| |x^{(i)\gamma} \left(\tau(n) \right) - x^{\gamma} \left(\tau(n) \right) | \right)^{\frac{1}{\gamma}}.
$$

Since $|x^{(i) \gamma}(\tau(n)) - x^{\gamma}(\tau(n))| \to 0$ γ ($\tau(n)$) γ $\tau(n)$) – $x^{\gamma}(\tau(n))$ \rightarrow 0 as $i \rightarrow \infty$ by applying the Lebeque dominated convergence theorem, we conclude that

 $\lim_{n \to \infty} \left\| \left(S_2 x^{(i)} \right) - \left(S_2 x \right)_{n} \right\| = 0$ $\lim_{n\to\infty}$ $\left\| \left(S_2 x^{(i)} \right)_n - \left(S_2 x \right)_n \right\| = 0$.

This means that S_2 is continuous. Finally we prove that S_2 is uniformly Cauchy. By (2.1) – (2.3), for any $\varepsilon > 0$, choose $n \ge n_1$ large enough so that

$$
\sum_{l=n}^{\infty} \sum_{t=l}^{\infty} \left(\left| \frac{1}{a(t)} \right| \sum_{s=t}^{\infty} |q(s)| M_1 + |e(s)| \right)^{\frac{1}{\gamma}} < \frac{\varepsilon}{2}.
$$

Then for $x \in \Omega$, $n_2 > n_1 > N$.

\n
$$
[(S_xx)_t - (S_xx)_x] \le \sum_{k=1}^{\infty} \sum_{n=1}^{\infty} \left(\left| \frac{1}{a(t)} \right| \sum_{k=1}^{\infty} q(s) \cdot x^r(\tau(n)) + |e(s)| \right)^{\frac{1}{r}}
$$
\n+
$$
\sum_{k=1}^{\infty} \sum_{n=1}^{\infty} \left(\left| \frac{1}{a(t)} \right| \sum_{k=1}^{\infty} |q(s)| \cdot x^r(\tau(n)) + |e(s)| \right)^{\frac{1}{r}}
$$
\n
$$
\le \sum_{k=1}^{\infty} \sum_{n=1}^{\infty} \left(\left| \frac{1}{a(t)} \right| \sum_{k=1}^{\infty} |q(s)| M_1 + |e(s)| \right)^{\frac{1}{r}}
$$
\n+
$$
\sum_{k=1}^{\infty} \sum_{n=1}^{\infty} \left(\left| \frac{1}{a(t)} \right| \sum_{k=1}^{\infty} |q(s)| M_1 + |e(s)| \right)^{\frac{1}{r}}
$$
\nThus *S*₁ is uniformly
\n
$$
(\sum_{k=1}^{\infty} \sum_{k=1}^{\infty} \left(\left| \frac{1}{a(t)} \right| \sum_{k=1}^{\infty} |q(s)| M_1 + |e(s)| \right)^{\frac{1}{r}}
$$
\nThus *S*₁ is uniformly
\n
$$
\sum_{k=1}^{\infty} \sum_{k=1}^{\infty} \sum_{k=1}^{\infty} e^{-x}.
$$
\nThus *S*₂ is uniformly
\n
$$
(S_xX)_t + (S_xX)_x = 1 + c_1 - p(n)x(\delta(n)) + \sum_{k=1}^{\infty} \sum_{k=1}^{\infty} \left(\frac{1}{a(t)} \sum_{k=1}^{\infty} q(s) x^r(\tau(s)) - e(s) \right)^{\frac{1}{r}}
$$
\n
$$
x(n) = 1 + c_1 - p(n)x(\delta(n)) + \sum_{k=1}^{\infty} \sum_{k=1}^{\infty} \left(\frac{1}{a(t)} \sum_{k=1}^{\infty
$$

Thus S_2 is uniformly Cauchy.

On summarizing the above cases we can conclude from the Kronoseselskii's fixed point theorem
re exists a fixed point x on Ω such that $(S_1x)_n + (S_2x)_n = x$, where $x = x(n)$ satisfies
 $(S_1x)_n + (S_2x)_n = 1 + c_1 - p(n)x(\delta(n)) + \sum_{n=1}^{\$

Thus
$$
S_2
$$
 is uniformly Cauchy.
\nOn summarizing the above cases we can conclude from the Kronoseselskii's fixed point the
\nthat there exists a fixed point x on Ω such that $(S_1x)_n + (S_2x)_n = x$, where $x = x(n)$ satisfies
\n
$$
(S_1x)_n + (S_2x)_n = 1 + c_1 - p(n)x(\delta(n)) + \sum_{l=n}^{\infty} \sum_{t=l}^{\infty} \left(\frac{1}{a(t)} \sum_{s=t}^{\infty} (q(s)x^{\gamma}(\tau(s)) - e(s)) \right)^{\frac{1}{\gamma}}
$$
\n
$$
x(n) = 1 + c_1 - p(n)x(\delta(n)) + \sum_{l=n}^{\infty} \sum_{t=l}^{\infty} \left(\frac{1}{a(t)} \sum_{s=t}^{\infty} (q(s)x^{\gamma}(\tau(s)) - e(s)) \right)^{\frac{1}{\gamma}}
$$

From this,
$$
x(n)
$$
 is a positive sequence. Differentiating three times the above expression, we get
\n
$$
\Delta\Big(a(n)\Big(\Delta^2\big(x(n)+p(n)x(\delta(n))\big)\Big)^r\Big)+q(n)x^r\big(\tau(n)\big)=e(n).
$$

Hence this fixed point $x(n)$ is a positive solution of the equation (1.1). This completes the proof of Theorem 2.2.

Theorem 2.3Assume that $-\infty < p(n) = c_2 < -1$ and that (2.1) to (2.3) Then equation (1.1) has a bounded nonoscillatory solution.

Proof: By (2.1) – (2.3), we choose a
$$
n_1 \ge n_0
$$
 sufficiently such that
\n
$$
-\frac{1}{c_2} \sum_{l=n_1+\delta}^{\infty} \sum_{t=l}^{\infty} \left(\left| \frac{1}{a(t)} \right| \sum_{s=t}^{\infty} |q(s)| M_2 + |e(s)| \right)^{\frac{1}{\gamma}} < -\frac{1}{2} (1+c_2).
$$

where $M_2 = \max_{\frac{(1+c_2)}{2} \le x \le -2c_2} |x^{y}(\tau(s))|$ 2 - $\frac{\ln a}{2}$
 $-\frac{(1+c_2)}{2} \le x \le -2$ $\max_{c_2 \geq x \leq -2c}$ $M_2 = \max_{\frac{(1+c_2)}{2} \leq x \leq -2c_2} x^{\gamma} \left(\tau \right)$ $= \max_{(1+c_2)} |x^{\gamma}(\tau(s))|$. Let $\ell_{n_0}^{\infty}$ ℓ_{n}^{∞} be the set of all real sequences with the norm

 $\mathbf{0}$ $||x|| = \sup_{n \ge n_0} |x(n)| < \infty$. Then $\ell_{n_0}^{\infty}$ ℓ_{n}^{∞} is a Banach space. We define a closed, bounded and convex subset Ω of $\ell_{n_{0}}^{\infty}$ as follows.

$$
\ell_{n_0}^{\infty} \text{ as follows.}
$$

\n
$$
\Omega = \left\{ x = \left\{ x(n) \right\} \in \ell_{n_0}^{\infty} : -\frac{1}{2} (1 + c_2) \le x(n) \le -2c_2, n \ge n_0 \right\}.
$$

Define two maps S_1 and S_2 : $\Omega \rightarrow \ell_{n_0}^{\infty}$ as follows:

 International Journal Of Engineering Research & Management Technology ISSN: 2348-4039 March-2016 Volume 3, Issue-2 www.ijermt.org

Email: editor@ijermt.org **March-2016 Volume 3, Issue-2**
\n
$$
(S_1x)_n = \begin{cases}\n-c_2 - 1 - \frac{1}{p(n)} x(n+\delta), & n \ge n_1, \\
(S_1x)_n, & n_0 \le n \le n_1.\n\end{cases}
$$
\n
$$
(S_2x)_n = \begin{cases}\n\frac{1}{p(n)} \sum_{l=n+\delta}^{\infty} \sum_{t=1}^{\infty} \left(\frac{1}{a(t)} \sum_{s=t}^{\infty} \left(q(s) x^r (\tau(s)) - e(s)\right)\right)^{\frac{1}{r}}, & n \ge n_1, \\
(S_2x)_n, & n_0 \le n \le n_1.\n\end{cases}
$$

(i) We shall show that for any $x, y \in \Omega$, $(S_1x)_n + (S_2y)_n \in \Omega$. In fact for every $x, y \in \Omega$ and $n \ge n_1$, we get

$$
(S_2x)_n = \begin{cases} p(n)_{\frac{1}{1-n+\delta}} \frac{1}{t-1} (a(t)_{\frac{1}{s-1}}(x)_{\frac{1}{s-1}}(x)_{\frac{1}{s-1}}(x))_{\frac{1}{s-1}}(x)_{\frac{1}{s-1}}(x)_{\frac{1}{s-1}}(x)_{\frac{1}{s-1}}(x))_{\frac{1}{s-1}}(x)_{\frac{1
$$

Furthermore we have,

$$
(S_{z}x)_{n} =\begin{cases}\n\left| \int_{S_{r}X_{n}} p_{n} \right|_{S_{r}X_{n}} & n_{0} \leq n \leq n_{1}.\n\end{cases}
$$
\n
$$
(S_{z}x)_{n} =\begin{cases}\n\frac{1}{P(n)} \int_{\cos \theta}^{S_{r}X_{n}} \left(\frac{1}{\alpha(t)} \int_{s=0}^{\infty} (q(s)x^{r} (r(s)) - e(s)) \right)^{\frac{1}{r}}, & n \geq n_{1}, \\
\left| (S_{z}x)_{n}, & n_{0} \leq n \leq n_{1}.\n\end{cases}
$$
\n(i) We shall show that for any $x, y \in \Omega$, $(S_{i}x)_{n} + (S_{2}y)_{n} \in \Omega$. In fact for every $x, y \in \Omega$ and $n \geq n_{1}$, we get\n
$$
(S_{i}x)_{n} + (S_{2}y)_{n} \leq -c_{2} - 1 - \frac{1}{P(n)} x(n + \delta) - \frac{1}{P(n)} \sum_{l=n}^{\infty} \sum_{i=1}^{\infty} \left(\frac{1}{\alpha(t)} \sum_{i=1}^{\infty} (q(s)y^{r} (r(s)) - e(s)) \right)^{\frac{1}{r}}
$$
\n
$$
\leq -c_{2} - 1 + 2 - \frac{1}{c_{2}} \sum_{l=n_{1}+s}^{\infty} \sum_{i=1}^{\infty} \left(\frac{1}{\alpha(t)} \sum_{s=1}^{\infty} (q(s)y^{r} (r(s)) - e(s)) \right)^{\frac{1}{r}}
$$
\n
$$
\leq -c_{2} - 1 - \frac{1}{c_{2}} \sum_{l=n_{1}+s}^{\infty} \sum_{i=1}^{\infty} \left(\frac{1}{\alpha(t)} \sum_{s=1}^{\infty} (q(s)y^{r} (r(s)) - e(s)) \right)^{\frac{1}{r}}
$$
\n
$$
\leq -c_{2} - 1 + \frac{1}{c_{2}} \sum_{l=n_{1}+s}^{\infty} \sum_{i=1}^{\infty} \left(\frac{1}{\alpha(t)} \sum_{s=1}^{\infty} \sum_{i=1}^{\infty} (q(s)y^{r} (r(s)) - e(s)) \right)^{\
$$

Hence

$$
-\frac{(c_2+1)}{2} \le (S_1x)_n + (S_2y)_n \le -2c_2.
$$

Thus we have proved that $(S_1x)_n + (S_2y)_n \in \Omega$ for any $x, y \in \Omega$. We shall show that S_1 is a contraction mapping on Ω . In fact $x, y \in \Omega$ and $n \ge n_1$ we have that $(S_1x)_n + (S_2y)_n \le 22$ for
 $x, y \in \Omega$ and $n \ge n_1$ we have
 $\frac{1}{\sqrt{1-x}} |x(n+\delta) - y(n+\delta)| \le -\frac{1}{\sqrt{1-x^2}}$

mapping on
$$
\Omega
$$
. In fact $x, y \in \Omega$ and $n \ge n_1$ we have
\n
$$
\left| \left(S_1 x \right)_n - \left(S_2 y \right)_n \right| \le -\frac{1}{p(n)} \left| x(n+\delta) - y(n+\delta) \right| \le -\frac{1}{c_2} \left\| x - y \right\|.
$$

Since 2 $0 < -\frac{1}{2} < 1$ *c* \lt – \lt 1 that S_1 is a contraction mapping on Ω . Proceeding similarly as in the proof of Theorem 2.2 we obtain S_2 is uniformly Cauchy. By Lemma 2.1, there is an $x^* \in \Omega$ such that $S_1x^* + S_2x^* = x^*$. It is easy to see that $x^* = \{x^*(n)\}$ is a nonoscillatory solution of the equation (1.1). This completes the proof of Theorem 2.3.

Theorem 2.4Assume that $0 < p(n) \le c_3 < 1$ and that (2.1) to (2.3) Then equation (1.1) has a bounded nonoscillatory solution.

Proof: By $(2.1) - (2.3)$, we choose a $n_1 \ge n_0$ sufficiently such that

 International Journal Of Engineering Research & Management Technology ISSN: 2348-4039 Email: editor@ijermt.org **March- 2016 Volume 3, Issue-2** www.ijermt.org

$$
\sum_{s=n_1}^{\infty} \sum_{t=l}^{\infty} \left(\left| \frac{1}{a(t)} \right| \sum_{s=t}^{\infty} |q(s)| M_3 + |e(s)| \right)^{\frac{1}{r}} < 1 - c_3.
$$

where $M_3 = \max_{2(1-c_3)\le x \le 4} |x^{\gamma}(\tau(s))|$. Let $\ell_{n_0}^{\infty}$ ℓ_{n}^{∞} be the set of all real sequences with the norm \mathbf{c} $\sup |x(n)$ *n n* $x \equiv \sup_{n \ge n_0} |x(n)|$ $=\sup |x(n)| < \infty$. $\ell_{n_{\rm s}}^{\infty}$ as follows.

Then $\ell_{n_0}^{\infty}$ $\ell_{n_0}^{\infty}$ is a Banach space. We define a closed, bounded and convex subset Ω of $\ell_{n_0}^{\infty}$ Then $\ell_{n_0}^{\infty}$ is a Banach space. We define a closed, bot $\Omega = \left\{ x = \{x(n)\}\in \ell_{n_0}^{\infty} : 2(1-c_3) \le x(n) \le 4, n \ge n_0 \right\}.$

Define two maps S_1 and S_2 : $\Omega \rightarrow \ell_{n_0}^{\infty}$ as follows:

Define two maps
$$
S_1
$$
 and $S_2 : \Omega \to \ell_{n_0}^{\infty}$ as follows:
\n
$$
(S_1x)_n = \begin{cases}\n3 + c_3 - p(n)x(\delta(n)), & n \ge n_1, \\
(S_1x)_n, & n_0 \le n \le n_1.\n\end{cases}
$$
\n
$$
(S_2x)_n = \begin{cases}\n\sum_{l=n}^{\infty} \sum_{t=l}^{\infty} \left(\frac{1}{a(t)} \sum_{s=t}^{\infty} (q(s)x^{\gamma}(\tau(s)) - e(s))\right)^{\frac{1}{\gamma}}, & n \ge n_1, \\
(S_2x)_n, & n_0 \le n \le n_1.\n\end{cases}
$$

(i) We shall show that for any
$$
x, y \in \Omega
$$
, $(S_1x)_n + (S_2y)_n \in \Omega$. In fact for every $x, y \in \Omega$ and $n \ge n_1$, we get
\n
$$
(S_1x)_n + (S_2y)_n \le 3 + c_3 - p(n)x(\delta(n)) + \sum_{l=n}^{\infty} \sum_{t=l}^{\infty} \left(\frac{1}{a(t)} \sum_{s=t}^{\infty} (q(s)y^{\gamma}(r(s)) - e(s)) \right)^{\frac{1}{r}}
$$
\n
$$
\le 3 + c_3 + \sum_{l=n_1}^{\infty} \sum_{t=l}^{\infty} \left(\frac{1}{a(t)} \sum_{s=t}^{\infty} |q(s)| M_3 + |e(s)| \right)^{\frac{1}{r}}
$$
\n
$$
\le 3 + c_3 + 1 - c_3 = 4.
$$
\nFurthermore we have

Furthermore we have,

$$
\sum_{l=n_1}^{3} \frac{1}{t-l} \Big(|a(t)| \Big|_{s=t}^{3} + 1 - C_3 \Big)
$$

\n
$$
\leq 3 + c_3 + 1 - c_3 = 4.
$$

\nFurthermore we have,
\n
$$
(S_1x)_n + (S_2y)_n \geq 3 + c_3 - p(n)x(\delta(n)) - \sum_{l=n_1}^{\infty} \sum_{t=l}^{\infty} \Big(\frac{1}{a(t)} \sum_{s=t}^{\infty} \Big(q(s) y^r (\tau(s)) - e(s) \Big) \Big)^{\frac{1}{r}}
$$

\n
$$
\geq 3 + c_3 - p(n)x(\delta(n)) - \sum_{l=n_1}^{\infty} \sum_{t=l}^{\infty} \Big(\frac{1}{a(t)} \Big| \sum_{s=t}^{\infty} |q(s)| M_3 + |e(s)| \Big)^{\frac{1}{r}}
$$

\n
$$
\geq 3 + c_3 - 4c_3 - (1 - c_3) = 2(1 - c_3).
$$

Hence

Hence
 $2(1-c_3) \le (S_1x)_n + (S_2y)_n \le 4$. for $n \ge n_0$.

Thus we have proved that $(S_1x)_n + (S_2y)_n \in \Omega$ for any $x, y \in \Omega$. Proceeding similarly as in the proof of Theorem 2.2 we obtain the mapping S_1 is a contraction mapping on Ω and the mapping S_2 is uniformly Cauchy. By Lemma 2.1, there is an $x^* \in \Omega$ such that $S_1x^* + S_2x^* = x^*$. It is easy to see that $x^* = \{x^*(n)\}$ is a nonoscillatory solution of the equation (1.1). This completes the proof of Theorem 2.4.

Theorem 2.5.Assume that $1 < c_4 \equiv < p(n) < \infty$ and that (2.1) to (2.3) Then equation (1.1) has a bounded nonoscillatory solution.

Proof: By $(2.1) - (2.3)$, we choose a $n_1 \ge n_0$ sufficiently such that

 International Journal Of Engineering Research & Management Technology ISSN: 2348-4039 Email: editor@ijermt.org **March- 2016 Volume 3, Issue-2** www.ijermt.org

$$
\frac{1}{c_4}\sum_{s=n_1+\delta}^{\infty}\sum_{t=l}^{\infty}\left(\left|\frac{1}{a(t)}\right|\sum_{s=t}^{\infty}|q(s)|M_4+|e(s)|\right)^{\frac{1}{\gamma}}
$$

Where $M_4 = \max_{2(c_4-1)\leq x \leq 4c_4} |x^{\gamma}(\tau(s))|$. Let $\ell_{n_0}^{\infty}$ $\ell_{n_b}^{\infty}$ be the set of all real sequences with the norm $\bf{0}$ $\sup | x(n)$ *n n* $||x|| = \sup_{n \ge n_0} |x(n)||$ $=\sup |x(n)| < \infty$. Then $\ell_{n_0}^{\infty}$ $\ell_{n_{\alpha}}^{\infty}$ is a Banach space. We define a closed, bounded and convex subset Ω of $n₀$ $\ell_{n_{\text{e}}}^{\infty}$ as follows.

$$
\ell_{n_0}^{\infty} \text{ as follows.}
$$

\n
$$
\Omega = \left\{ x = \left\{ x(n) \right\} \in \ell_{n_0}^{\infty} : 2(c_4 - 1) \le x(n) \le 4c_4, n \ge n_0 \right\}.
$$

Define two maps
$$
S_1
$$
 and $S_2 : \Omega \to \ell_{n_0}^{\infty}$ as follows:
\n
$$
(S_1x)_n = \begin{cases}\n3c_4 + 1 - \frac{1}{p(n)}x(n+k), & n \ge n_1, \\
(S_1x)_n, & n_0 \le n \le n_1.\n\end{cases}
$$
\n
$$
(S_2x)_n = \begin{cases}\n\frac{1}{p(n)} \sum_{l=n+\delta}^{\infty} \sum_{t=l}^{\infty} \left(\frac{1}{a(t)} \sum_{s=t}^{\infty} (q(s)x^r(\tau(s)) - e(s))\right)^{\frac{1}{r}}, & n \ge n_1, \\
(S_2x)_n, & n_0 \le n \le n_1.\n\end{cases}
$$

(i) We shall show that for any $x, y \in \Omega$, $(S_1x)_n + (S_2y)_n \in \Omega$. In fact for every $x, y \in \Omega$ and $n \ge n_0$, we get

$$
(S_2x)_n = \begin{cases} p(n) \frac{1}{1-n+\delta} & \text{if } n \neq 1 \ (a(t) \frac{1}{s+t})^{-1} \ (a(t) \frac{1}{s+t})^{-1} & \text{if } n \neq 1 \end{cases}
$$

(i) We shall show that for any $x, y \in \Omega$, $(S_1x)_n + (S_2y)_n \in \Omega$. In fact for every $x, y \in \Omega$ and $n \ge n_0$, we get

$$
(S_1x)_n + (S_2y)_n \le 3c_4 + 1 - \frac{1}{p(n)}x(n+k) + \frac{1}{p(n)} \sum_{l=n+\delta}^{\infty} \sum_{t=1}^{\infty} \left(\frac{1}{a(t)} \sum_{s=t}^{\infty} (q(s) y^r(\tau(s)) - e(s)) \right)^{\frac{1}{r}}
$$

$$
\le 3c_4 + 1 + \frac{1}{c_4} \sum_{l=n_1}^{\infty} \sum_{t=1}^{\infty} \left(\frac{1}{a(t)} \left| \sum_{s=t}^{\infty} |q(s)| M_4 + |e(s)| \right)^{\frac{1}{r}}
$$

$$
\le 3c_4 + 1 + (c_4 - 1) = 4c_4.
$$

Furthermore we have,
$$
(S_1x)_n + (S_2y)_n \ge 3c_4 + 1 - \frac{1}{p(n)} x(n+k) - \frac{1}{p(n)} \sum_{l=n+\delta}^{\infty} \sum_{t=1}^{\infty} \left(\frac{1}{a(t)} \sum_{s=t}^{\infty} (q(s) y^r(\tau(s)) - e(s)) \right)^{\frac{1}{r}}
$$

Furthermore we have,

$$
\leq 3c_4 + 1 + (c_4 - 1) = 4c_4.
$$

\nFurthermore we have,
\n
$$
(S_1x)_n + (S_2y)_n \geq 3c_4 + 1 - \frac{1}{p(n)}x(n+k) - \frac{1}{p(n)}\sum_{l=n+\delta}^{\infty}\sum_{t=l}^{\infty} \left(\frac{1}{a(t)}\sum_{s=t}^{\infty} (q(s)y^{\gamma}(r(s)) - e(s))\right)^{\frac{1}{\gamma}}
$$
\n
$$
\geq 3c_4 + 1 - \frac{1}{p(n)}x(n+k) - \frac{1}{c_4}\sum_{l=n_1}^{\infty}\sum_{t=l}^{\infty} \left(\left|\frac{1}{a(t)}\right|\sum_{s=t}^{\infty} |q(s)|M_4 + |e(s)|\right)^{\frac{1}{\gamma}}
$$
\n
$$
\geq 3c_4 - 3 - (c_4 - 1) = 2(c_4 - 1).
$$

Hence

Hence
 $2(c_4-1) \le (S_1x)_n + (S_2y)_n \le 4c_4$ for $n \ge n_0$.

Thus we have proved that $(S_1x)_n + (S_2y)_n \in \Omega$ for any $x, y \in \Omega$. Proceeding similarly as in the proof of Theorem 2.2 we obtain the mapping S_1 is a contraction mapping on Ω and the mapping S_2 is uniformly Cauchy. By Lemma 2.1, there is an $x^* \in \Omega$ such that $S_1x^* + S_2x^* = x^*$. It is easy to see that $x^* = \{x^*\}$ is a nonoscillatory solution of the equation (1.1). This completes the proof of Theorem 2.5.
